## Graphing: Linearization

You may have seen the following graphs below:

3)

2)

4)

You might notice that a best fit line does not work so well in most of the above situations.

Which one of these graphs best fit your data? $\qquad$

Since it is difficult to quantitatively analyze your graph, it is better if we linearize your graph. In other words, "straighten out" your graph. It is much easier to calculate slope from a linear graph than from a curved graph.

With a graph in the form of $y=m x+b$, it will be much easier to measure the slope.

## Example 1:

Let's say we want to figure out what " $a$ " is in $y=a x^{2}$. How do we convert a graph like $y=a x^{2}$ to $y=m x+b$ ? What does the slope " $m$ " mean in the linearized graph?

| $x$ |  | $y$ |
| :--- | :--- | :--- |
| 1 |  | 3 |
| 2 |  | 12 |
| 3 |  | 27 |
| 4 |  | 48 |
| 5 |  | 75 |
| 6 |  | 108 |

## Example 2:

How do we convert a graph like $y=a \sqrt{b x}$ to the $\mathrm{y}=\mathrm{mx}+\mathrm{b}$ form? What does the slope mean?

| $x$ |  | $y$ |
| :--- | :--- | :--- |
| 1 |  | 3.46 |
| 2 |  | 4.90 |
| 3 |  | 6 |
| 4 |  | 6.93 |
| 5 |  | 7.75 |
| 6 |  | 8.49 |

Draw the graph for the following data and linearize the $2^{\text {nd }}$ graph. What model fits your data set the best?

| $x$ |  | $y$ |
| :--- | :--- | :--- |
| 1 |  | 2 |
| 2 |  | 1 |
| 3 |  | $2 / 3$ |
| 4 |  | $1 / 2$ |
| 5 |  | $2 / 5$ |
| 6 |  | $1 / 3$ |

Extra practice: Find the best fit slope of the linearized graphs above.
