Name: $\qquad$

## Practice Unit Test

Follow the instructions carefully and apply everything you learned in this unit. Show all your work on separate sheets of lined and graph paper.

1) Graph the following data with appropriate error bars.

Table 1. Distance traveled by car over time.

| Trial | Time $(\mathrm{s})( \pm 0.03 \mathrm{~s})$ | Distance $(\mathrm{m})( \pm 0.2 \mathrm{~m})$ |
| :---: | :---: | :---: |
| 1 | 0.50 | 1.9 |
| 2 | 1.00 | 8.1 |
| 3 | 1.50 | 15.9 |
| 4 | 2.00 | 29.0 |
| 5 | 2.50 | 47.2 |
| 6 | 3.00 | 65.7 |

2) Sketch the best fit line on your first graph.
3) Showing your calculations, linearize and plot your $2^{\text {nd }}$ graph on another sheet of graph paper (or flip side of $1^{\text {st }}$ graph).
4) Showing your calculations, draw the error bars on your $2^{\text {nd }}$ graph.
5) Draw the best and worse fit lines and calculate the max, best, and min slope of your linearized graph.
6) Calculate your slope uncertainty and write down your final $m_{\text {best }}$ slope.

Bonus: Given that the equation $d=v t+\frac{1}{2} a t^{2}$ find the acceleration of the car including units and uncertainty.
